80 bp DNA

Human alpha-galactosidase breakpoint region.

M36131

M36131. GI:179541

Fabry disease; breakpoint junction; glycosphingolipid catabolism.

Human DNA.

Homo sapiens

Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;

Eukheria; Primates; Catarrhin; Hominidae; Homo.

HIV-LP useful in vaccine formulations - is novel HIV virus distinct from HIV-1 and or HIV-2 viruses

T distinct from HIV-1 and or HIV-2 viruses

Example; page 7; 75pp; English.

C HIV-LP is a new variant of the HIV family. A cDNA first strand was synthesised from Pt. 1 pellet using MLV RT. The product was converted into dsDNA and this cDNA was amplified by PCR using primers Q55167 and Q55168.

C primers Q55167 and Q55168.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29696 AAAAAAAAAAAAAAAAAAAAAAAAGAAT 29723
                                                                                                                                                                                                                                                                                                                                                                                                                                               Trypsin inhibitory protein cDNA antisense primer-1.

                                                                                                                                                                                                               A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences or given in T19001-T25837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-oriented cDNA by using poly(T) as the sole primer. Since the 3'-outranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency off a given GS in a cDNA library can be determined (sep. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 51 BP; 14 A; 16 C; 12 G; 9 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The polypeptide was isolated from human 198G cells and is useful for treating pancreatitis, shock, multiple organ failure and disseminated intravascular coagulation. The present sequence is that of an antisense primer used for cloning 198G cDNA coding for the full-length polypeptide. Sequence 48 BP; 2 A; 1 C; 1 G; 44 T;

Q95177 is a simple tandem repeat (STR) corresponding to the 2nd part of wgla2. The STR can be used for treatment and diagnosis in human and veterinary medicine, partic. for genetic characterisation, mapping, linkage studies and analysis/diagnosis of acquired disease alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    29-JUN-1995.

PT useful in medical diagnosis

PT claim 2; Page 11; 15pp; English.

CC The sequence is an example of a preferred T7 RNA polymerase of the sequence is an example of a preferred to the 3' end of the promoter for use in the invention. There can be from 2 to 50 T's in the loop region. A probe sequence is ligated to the 3' end of the promoter region. Upon hybridisation of the probe to a target sequence and ligation of the hybridisation of the probe to a target sequence and ligation of the hybridisad target sequence to the 5' end of the CC and ligation of the hybridisad target sequence to the 5' end of the CC hairpin-forming sequence, the target sequence to be amplified CC and detected) using a single oligonucleotide component (c.f. PCR).

Example 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the All repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

The use of a polymerase gene from RNA viruses can provide for production of less mutagenic recombinant viruses. The recombinant viruses can be used in vaccines which have a reduced risk of loss or reduction of efficacy. The vaccines are used particularly for protecting swine against PRRSV. The high fidelity RNA polymerase gene can be used as a marker that allows organisms vaccinated with such a vaccine to be distinguished from organisms naturally infected with wild type strains of virus or other vaccines. The present sequence represents a PCR primer used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Saccharomyces sp

PT Virus containing nucleic acid and protein sections - for use in windification and creation of functional bio:polymers such as renzymes, antibodies and ribozyme(s)
PT enzymes, antibodies and ribozyme(s)
PS Example 1; Page 44; 68pp; Japanese.
CThe present sequence is used in the course of the invention. The specification describes a molecule for bringing together genotype with phenotype (in vitro virus). The molecule contains a nucleic acid phenotype (in vitro virus). The molecule contains a nucleic acid fragment having a base sequence corresponding to a genotype, covalently completed to a protein fragment containing a protein participating in phenotype expression, the 3'-end of the nucleic acid part being bonded to the C-terminus of the protein part via a puromycin molety. The nucleic acid fragment preferably consists of RNA corresponding to the gene (free adapter (such as a DNA-tRNA hybrid containing an anticodon corresponding to the terminator codon of the gene) and a puromycin-containing cap capable of binding to an amino acid residue. Translation of the virus is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences of in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences of as a means of diagnosing abnormal cell function or for sequences as a means of diagnosing abnormal cell function or for Sequence 61 BP; 23 A; 12 C; 14 G; 12 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

PT Sequencing nucleic acid by mass spectrometric analysis - for Sequencing nucleic acids, telomerase activity, oncogene mutations, or PT cancer-specific sequences, for diagnosis of disease
PS Example 11; Page 318; 478pp; English.

CA process has been developed for determining the sequence of a target cucleic acid. The process comprises: (1) generating at least two fragments (F) from the target nucleic acid; and (ii) analysing F by CC mass spectrometry (MS). The sequences in V39483 to V39592 are specifically claimed primers for use in the mass spectrometric analysis CC of the above process. The process is used to detect genetic diseases (e.g. haemophilia, thalassemia, Duchenne muscular dystrophy, Alzheimer's CC (e.g. haemophilia, thalassemia, Duchenne muscular dystrophy, Alzheimer's CC (or predisposition); infections and cancers; also for establishing CC identity and heredity. Particular applications are diagnosis of neuroblastoma, detecting telomerase, determining family relationships CC and HLA compatibility, and in genetic fingerprinting. Compared with CC known methods using MS, this process requires fewer specific reagents CC and HLA compatibility and in genetic fingerprinting. Compared with CC known methods using MS, this process requires fewer specific reagents and is better suited to automation. Extended primers are shorter; and is better suited to automation and the process allows detection of CC many sequences simultaneously. The present sequence represent an CC oligonucleotide used in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      performed in a non-cellular (preferably ribosomal) system (e.g. E. coli ribosome), the protein synthesised by the translation attaching to the puromycin cap, resulting in the complete in vitro virus structure. The method is used in molecular evolutionary engineering to optimise function of a functional biopolymer such as an enzyme, antibody or ribozyme, or to generate new functionality. The virus can be used for the functional optimisation of nucleic acid or protein sequences.

                                                                                                                                                                                                                                                                                                                                                                                                             CC The present invention describes a method for detecting a target nucleic cc acid sequence (I) in a sample. The method comprises: (a) hybridising (I) CC to the probe ends of a probe having 2 free nucleic acid end parts, which cc are at least partially complementary to and capable of hybridising to CC at least 2 neighbouring regions of (I); (b) covalently connecting the cends of the hybridised probe with each other to form a circularised CC structure; (c) washing under denaturing conditions, characterised in that the probe is provided with a cleavable or dissociable detectable function; (d) cleaving or dissociating the detectable function; (e) CC separating probes with connected ends from probes with non-connected ends by washing under denaturing conditions; and (f) detecting the presence and, if desired, location of the remaining probe as indicative of the presence of (I). The present sequence represents a padlock probe, can be used to detect, quantify and distinguish between sequence variants with regard to 1 or several (I) in a sample. It can be used to disease, for genetic linkage analysis of biallelic markers and to consect that it reports the presence of (I) by allowing a detectable consisting to remain bound only if the probe has been cyclised in a target dependent linking reaction. It also provides for high specificity and consecuence of the presenticity and capable to be a consecuence of the presence of (I) by allowing a detectable consisting the probe has been cyclised in a target dependent linking reaction. It also provides for high specificity and consecuence of the presenticity and capable to be a consecuence of the presenticity and capable to be a consecuence of the presenticity and capable to be a consecuence of the presenticity and capable to be a consecuence of the presenticity and capable to be a consecuence of the presenticity and capable to be a consecuence of the presenticity and capable to be a consecuence of the presenticity and capable to be a consecuence of the presenticity and capable

A subtracted cDNA library was generated from the RNA of lymphocytes obtd. from monozygotic twins discordant for schizophrenia. The two oligos used in library construction were T7 promoter and SP6 promoter (see Q75091, Q75092). A cDNA library was made for each twin and subtractive hybridisation was achieved. Both libraries were used as driver and substrate in two separate subtraction assays. Clone pOKS18a was isolated and sequenced. Sequence 95 BP; 12 A; 14 C; 30 G; 39 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WO9426107-A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to Ecorl adaptors, 5 cycles of PCR applied to the CDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."

Individual FH 295 carries two mutant LDL receptor alleles. The allele below was inherited from the and includes a duplication of exons 2 through 8 that was presumably created by unequal chromosomal crossover involving Alu repeats in introns 1 and 8. The exact site of recombination cannot be determined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     l (bases 1 to 90)
Lehrman, M.A., Goldstein, J.L., Russell, D.W. and Brown, M.S.
